

## That's Not Volatility

The financial press has been flooded in recent weeks with articles about the volatility present in markets today. This theme has been taken up in spades across markets. This **Market Commentary** contains 15 charts across precious and base metals, the equity, currency and interest rate markets, and economic trends such as growth in real gross domestic product and inflation. With the possible exception of currency exchange rates, the volatility of most of these financial, economic, and metal market prices has not been particularly high. In many cases, it has been very low. The markets protest too much.

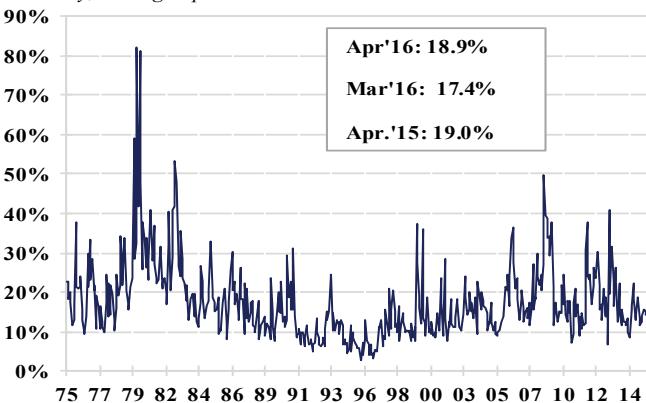

### *So What Is It*

The question is what is causing the ill ease in markets if it is not actual volatility. Sensationalist reporting clearly has infected the financial press, but it merely is a symptom of larger problems, albeit clearly a symptom exacerbating conditions.

## Precious Metals

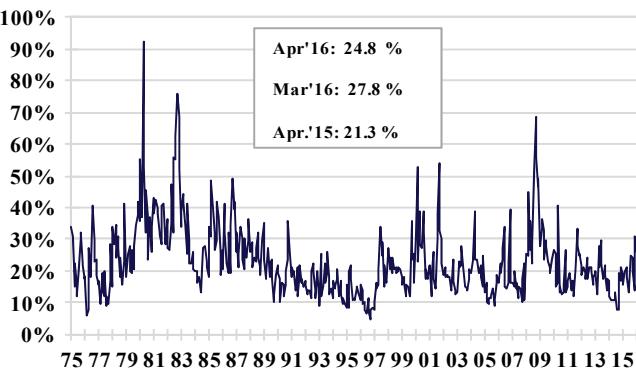

### Gold Price Volatility

Monthly, Through April 2016

### Platinum Price Volatility

Monthly, Through April 2016

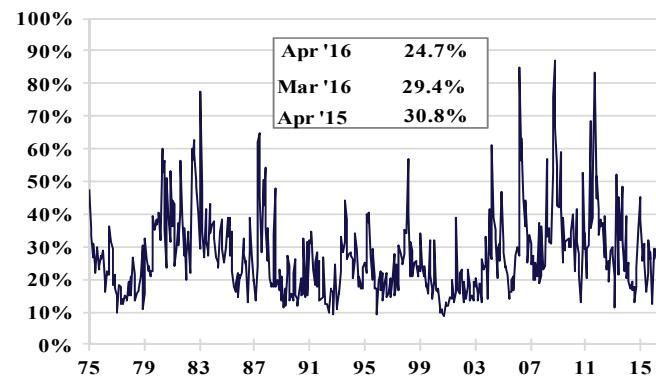

What seems to be gripping markets, causing corporate management and investors alike to hesitate in making investment decisions is *uncertainty* and *concern* over the future, fueled by the political rhetoric in the United States presidential election campaign and a wave of political problems ranging from the 23 June British referendum on staying in the European Union to the impeachment proceedings in Brazil, and U.S. Navy sabre-rattling from the Baltic to the South China Sea.

These political developments threaten to complicate the global economy's ability to grow, and that could lead to future volatility across markets. Shifts in the relative economic performance outlook away from the United States toward other countries is adding to the uncertainty, clear already in the currency markets, and limiting in its effects on overall growth and commodity use.

It is concern over *potential future volatility* that is what has caused markets to be dead in the water. This could be the calm period before storms arrive.
